

KISOFT ELECTRONIC PICKING LIST

EFFICIENT PICKING PROCESS DUE TO HANDS FREE

KiSoft EPL (Electronic Picking List) is a new picking solution which can be combined with KNAPP products or via an interface with all established enterprise resource planning and warehouse management systems.

KiSoft EPL increases the productivity, accuracy and flexibility of the picking process. The electronic picking list enables the picker to freely select the picking sequence of the enlisted orders. Furthermore the picker has both hands free for his work and confirms the picking process by simply pushing a button.

These qualities make KiSoft EPL particularly useful for the FMCG area.

Confirmation of the correct picking location with a check digit

KISOFT EPL - A NEW WORKING DIMENSION

- More flexibility during the picking process and a clear overview of several picking positions
- Hands free for picking
- Confirmation of the pick with a check digit either on the touch screen or on the L-O-G-I-M push-button-unit, alternatively One-Touch-Pick
- No data retyping in the warehouse management system necessary
- Hardware independent with Java
- Increasing the productivity by approximately 10%
- Short amortisation period

KNAPP is an investment for the future.

FLEXIBLE PICKING WITH A CLEAR OVERVIEW

The electronic picking list KiSoft EPL is displayed on a terminal (installed on the forklifts, but also Tablet-PCs or handheld terminals with a large display are possible). This clear presentation of several picking orderlines gives the picker the chance to flexibly change the picking sequence always considering the time and space available. The display of the picking orders was designed in a way which allows the picker to make it out even from larger distances. The installation of this display on the picking vehicles enables the picker to freely use both hands for the loading. He is not handicapped with the handling of the picking lists.

KISOFT EPL PUSH-BUTTON-UNIT

With an accelerated picking process we attach great importance to the highest possible security measures. Therefore, the KiSoft EPL system solution is provided with a push-button-unit which enables the confirmation of the pick by simply pushing a button. The used check digits of the word LOGIM are calculated per algorithm (without any particular connection to the storage location) and are applied above the storage location. This helps to ensure that at all times the correct good is picked from the corresponding storage location.

SHORT AMORTISATION PERIOD

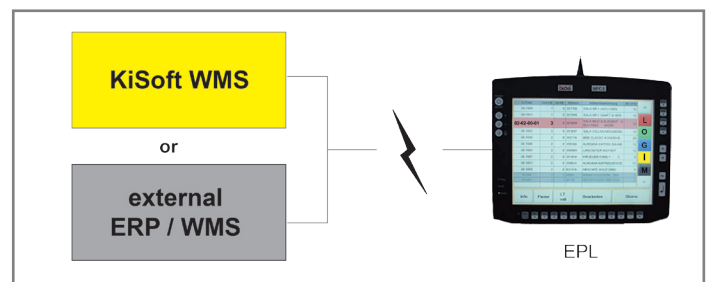

KiSoft EPL is highly flexible in use and can also be installed on certified PDAs, Tablet-PCs and handheld terminals. The accumulation of the mentioned advantages of KiSoft EPL results in an increase of the productivity by approximately 10% which explains the short amortisation period.

CLIENT-SERVER-TECHNOLOGIE

The KiSoft EPL server transfers the data to the clients via wireless network without any command of the picker.

MULTILINGUAL FUNCTIONALITY

The KiSoft EPL system solution offers the possibility to change the language for each individual user via the personal user profile. This guarantees the highest possible comfort as well as an improved user navigation through the
