All-in-one logistics software

Our intelligent KiSoft suite covers all the levels of software, from warehouse management to the control of optical sensors. Smart analysis tools help keep track of everything and ensure that your system and business performs optimally along the entire value chain.

Warehouse nanagement

The warehouse management software KiSoft WMS plans, monitors and optimizes all processes, from goods-in to goods-out, including all internal warehouse processes. KiSoft WMS makes it possible to achieve the flexibility and transparency needed to satisfy the demands in various sectors. The software is suitable for any warehouse, whether it handles processes manually, semi- or fully automatically, and can be integrated into the automation technology from different suppliers.

Warehouse control

The warehouse control system KiSoft WCS controls and coordinates the flow of goods in automated areas in real time. KiSoft WCS controls and monitors the execution of processes, handles the integration of the subsystems, and can also be retrofitted into warehouse systems with existing automation technology.

Machine control

End-to-end software solutions down to the machine level ensure the maximum performance of your system. For example, the machine control system makes sure that the conveyor system, shuttle systems and picking robots are finely attuned to each other. KiSoft SCADA provides a full overview of the technical status of the entire warehouse, providing a global visualization of all the components in the system.

Add-ons

Why not consider our add-ons to put the finishing touches to your solution? KiSoft Pack Master, for example, is a useful software for calculating the best possible stacking patterns. KiSoft Sandbox provides a test and emulation environment, and KiSoft Pickup and Delivery offers integrated transport management, with shipment tracking all the way to the recipient.

Analytics

The smart tool KiSoft Analytics transforms vast pools of disorganized data into comprehensible, coherent streams of information. It also allows you to conduct analyses across all locations, independent of the systems' degree of automation and manufacturer. With this tool, you can make the right strategic decisions for your logistics at the right time.

easyUse

Our easyUse operating concept banks on intuitive human-machine communication and ensures userfriendly operation in every respect. Well-structured user interfaces, clear instructions and information on errors help boost performance and increase employee satisfaction.

Flexibility (Industry know) Investment security

Have you ever heard of the 90/10 rule?

In an automation project, software only accounts for about 10 percent of the investment. In a running warehouse operation however, the software is responsible for up to 90 percent of the success of the logistics system. That's why we take time at the beginning of a project to define the optimal software solution and processes for you.
